Iris Missouriensis

Iris missouriensis was first recognized as a distinct species by Nuttall in 1834 and named for the river near which he discovered it. It is now regarded as a large complex of most variable forms and varieties or possibly sub-species scattered widely over the entire west and including those iris formerly known as *I. arizonica* and *I. montana*. Plants grow from 10 to 30 inches high, bloom just ahead of the Siberians, which they very much resemble, and ask no more than that they be allowed to dry out in summer, after they have become established. Like Siberians, they do not perform typically until the second year after planting and succeed best if allowed plenty of water during the first summer; thereafter they are self-reliant.

Missouriensis Julesburg—unveined soft blue from Colorado \$1.00

Missouriensis Snowbird (Andrews 1922)—white from Colorado \$1.00

Missouriensis Bluebird (Andrews 1922)—violet-blue from Colorado \$1.00
